UNITED STATES DISTRICT COURT DISTRICT OF MASSACHUSETTS

JOSEPH J. DIBENEDETTO, Plaintiff,

VS.

NATIONAL RAILROAD PASSENGER CORPORATION, Defendant. CIVIL ACTION NO.: 04-10570-RCL

DEFENDANT NATIONAL RAILROAD PASSENGER CORPORATION'S MOTION IN LIMINE TO PRECLUDE THE TESTIMONY OF THE PLAINTIFF'S EXPERT WITNESSES

The defendant National Railroad Passenger Corporation ("AMTRAK") moves in limine to exclude the testimony of the plaintiff's expert witnesses, Dr. Jesse Jupiter and Robert Andres, on the grounds that: (1) neither of these witnesses were identified or disclosed in a timely fashion, or in compliance with Fed. R. Civ. P. 26's disclosure requirements; and (2) their expected opinions do not meet the requirements of Fed. R. Evid. 702 and the standards established by the Supreme Court in <u>Daubert v. Merrill-Dow Pharmaceuticals</u>, Inc., 509 U.S. 579 (1993). As further grounds, the defendant states as follows:

I. <u>FACTUAL BACKGROUND</u>:

The plaintiff claims in this Federal Employers' Liability Act ("FELA") case that he was injured as a result of exposure to cumulative trauma that he experienced in his railroad workplace over the course of several years. He has been employed by the

¹ The plaintiff filed his original *Complaint* on September 20, 2002. The plaintiff had been experiencing symptoms in his right wrist going back more than three (3) years beforehand. *See* Dr. Mark C. Gebhardt medical record, a copy of which is attached as Exhibit "A"; *see also* relevant portions of plaintiff's deposition transcript at p. 51-54, copies of which are attached as Exhibit "B." He even complained to his doctors about these symptoms on August 20, 1999. Exh. A. Moreover, the plaintiff specifically attributed the onset of these symptoms with his work-related activities. Id. (the plaintiff related that his symptoms

Page 2 of 84

defendant as a carman since the mid-1980's. A carman performs a variety of routine maintenance and repair tasks on railroad passenger cars, including changing brake shoes, changing out air hoses and installing and disconnecting electric cables. The plaintiff claims that the everyday activities of his job (primarily the use of a hammer) exposed him to "occupational risk factors for carpal tunnel syndrome, including but not limited to repetition, force, vibration and awkward wrist posture" and resistive motions of the hand and wrist which have led to his injuries. *See* plaintiff's *Complaint*, ¶8, a copy of which is attached hereto as Exhibit "C." He also claims that his injuries were caused by the defendant's "failure to provide a timely and adequate ergonomic program designed to prevent occupational carpal tunnel syndrome." <u>Id</u>. at ¶9(b).

In his *Complaint*, the plaintiff specifically alleged that he suffered right "carpal tunnel syndrome" as a result of these workplace activities. Exh. C at ¶11-13. The *Complaint* fails to mention any other injury or medical condition. Yet the plaintiff has never been diagnosed with, or treated for, carpal tunnel syndrome. Exh. B at 195-197. Instead, the plaintiff's treating physician, Dr. Jesse Jupiter, has diagnosed "interarticular arthritis" of the right wrist, a completely distinct and unrelated medical condition. *See* Dr. Jupiter's October 10, 2005 letter to plaintiff's counsel, a copy of which is attached as Exhibit "D."

In his records pertaining to his care and treatment of the plaintiff, Dr. Jupiter never diagnosed carpal tunnel syndrome and instead gave interarticular arthritis as the only diagnosis. He also failed, at any point in his medical records, to indicate an opinion as to the cause of this condition or that the plaintiff suffers from a permanent partial

were "aggravated by swinging a hammer" and that they were brought on by "resistive motions of the hand and wrist"); Exh. A; Exh. B at p. 51-54.

disability. More specifically, he did not opine, in his records or otherwise, that the plaintiff's arthritis was caused by the repetitive nature of his work activities.

The plaintiff has failed to identify and/or properly disclose a single liability or medical expert witness to testify that his injuries were caused by his workplace activities.² The plaintiff on November 7, 2005 (after the discovery and Rule 26 deadlines had long since passed), in a letter to defendant's counsel, identified Robert Andres as a potential witness. This was the first notice that the defendant ever received regarding the plaintiff's intention to use Mr. Andres. Plaintiffs' counsel's November 7, 2005 letter stating that he intended to use Mr. Andres did not comply with the requirements of expert disclosure under Rule 26. To date, the plaintiff has failed to provide any disclosures regarding Mr. Andres or any other liability expert.

The plaintiff has also failed to identify Dr. Jupiter, or any other physician, as an expert medical witness and has failed to provide any of the disclosures required by Rule 26 with any opinion testimony which he expects to elicit from Dr. Jupiter. Dr. Jupiter did write a letter to plaintiff's counsel dated October 10, 2005, in which he mentioned a number of issues which he had never before mentioned in the records of his care and treatment of the plaintiff. Exh. D. However, the plaintiff did not produce this letter to defendant's counsel until on or about October 25, 2005. *See* letter from plaintiff's counsel dated October 25, 2005, a copy of which is attached as Exhibit "E." The letter describes Dr. Jupiter's treatment of the plaintiff including a statement that the plaintiff's

²In case such as this, involving complex medical issues, where the causal connection is not obvious to a layman, "such as a broken leg from being struck by an automobile," expert testimony is required. <u>Schmaltz v. Norfolk & Western Ry.</u>, 896 F. Supp. 180 (N.D.III. 1995) *quoting* <u>Moody v. Maine Central Railroad Co.</u>, 823 F. 2d 693, 695 (1st Cir. 1987); *see also* <u>Claar v. Burlington Northern Railroad Co.</u>, 29 F.3d 499, 503 (9th Cir. 1994) ("where special expertise is necessary to draw a causal inference, expert testimony is necessary."); 4 F. Harper, F. James, O. Gray, <u>The Law of Torts</u>, 269.

"symptoms appear to be precipitated by events that occurred while in his employment." Exh. D. Dr. Jupiter also states that the plaintiff has a 20% permanent partial disability of his right wrist – this prognosis was never before expressed in Dr. Jupiter's records.

To the extent this letter purports to qualify as a Rule 26 disclosure,³ it is untimely. The pre-trial orders in this case established a deadline of December 31, 2004 for the plaintiff to disclose his experts and a deadline of February 27, 2005 for expert discovery. See docket report, a copy of which is attached hereto as Exhibit "F." The Court, on June 9, 2005, also set a date for trial and stated that "no more discovery will be allowed in this case." Id. The Court has also consistently enforced its deadlines in this case. For instance, the Court on August 4, 2005 denied the defendant's motion to conduct discovery and designate expert witnesses. A copy of the defendant's Motion for Leave to Conduct Discovery and the Court's Order denying the motion, are attached as Exhibit "G." More recently, on December 23, 2005, the Court denied the plaintiff's Motion to Enter Premises, which sought permission to have Mr. Andres conduct a site inspection, stating that this motion "has been filed well after the deadline set by the court for the completion of discovery." A copy of the Court's December 23, 2005 Order is attached as Exhibit "H."

II. DISCUSSION OF LAW:

A. <u>Dr. Jupiter's Opinions, Which Were Neither Developed Nor Expressed</u>

<u>During The Normal Course Of His Care And Treatment Of The Plaintiff,</u>

<u>Should Be Excluded Because The Plaintiff Has Not Identified Dr. Jupiter As An Expert and Has Otherwise Failed to Comply With Rule 26's Requirements:</u>

-

³ It is the defendant's position that Dr. Jupiter's letter does not meet Rule 26's disclosure requirements. The letter itself does not contain an adequate description of Dr. Jupiter's expected testimony, nor does he express any opinion to the requisite degree of certainty. Moreover, the plaintiff has failed, to date, to provide any of the other information required by Rule 26, such as Dr. Jupiter's curriculum vitae, a list of his publications, a schedule of charges or Dr. Jupiter's testimonial history.

The plaintiff has failed to identify Dr. Jupiter as an expert witness. He has also failed to provide any of the disclosures required by Rule 26. Therefore, Dr. Jupiter should be excluded from testifying about opinions which were neither developed nor expressed during the normal course of his care and treatment of the plaintiff, including but not limited to the cause of the plaintiff's injuries.

Fed. R. Civ. P. 26(a)(2) requires:

Except as otherwise stipulated or directed by the court, this disclosure shall, with respect to a witness who is retained or specially employed to provide expert testimony in the case or whose duties as an employee of the party regularly involve giving expert testimony, be accompanied by a written report prepared and signed by the witness. The report shall contain a complete statement of all opinions to be expressed and the basis and reasons therefore; the data or other information considered by the witness in forming the opinions; any exhibits to be used as a summary of or support for the opinions; the qualifications of the witness, including a list of all publications authored by the witness within the preceding ten years; the compensation to be paid for the study and testimony; and a listing of any other cases in which the witness has testified as an expert at trial or by deposition within the preceding four years.

Fed. R. Civ. P. 26(a)(2)(B). Although a treating physician may, in certain circumstances, be deposed or called to testify at trial without adhering to the requirement of a written report, a treating physician who has formulated opinions going beyond what was necessary to provide appropriate care for the injured party steps into the shoes of a retained expert for purposes of Fed. R. Civ. P. 26(a)(2) and a written report is required. Thomas v. Consolidated Rail Corporation, 169 F.R.D. 1, 2-3 (D. Mass 1996); see also Musser v. Gentiva Health Servs., 356 F.3d 751 (7th Cir. 2004); Wreath v. United States, 161 F.R.D. 448, 449 (D. Kan. 1995); O'Conner v. Commonwealth Edison Co., 13 F.3d 1090, 1105 n.14 (7th Cir. 1994) (we do not distinguish the treating physician from other experts when the treating physician is offering expert testimony regarding causation). In

Thomas, the Court stated that when treating physicians are going to testify, not merely based on observations made during the course of treatment but on professional expertise going beyond the treatment per se (i.e., causation and prognosis), a report pursuant to Fed. R. Civ. P. 26(a)(2) is required. Thomas, 169 F.R.D. at 3. The Thomas Court recognized "the unfairness of permitting a party to employ a physician who treated an injured party to provide testimony extending beyond simply the care of the plaintiff to classic expert opinion regarding causation and prognosis." Id. at 2.

As discussed supra, Dr. Jupiter treated the plaintiff for, and diagnosed the plaintiff with, interarticular arthritis of the right wrist. Exh. D. However, during the course of Dr. Jupiter's treatment of the plaintiff, which was primarily conducted between May 2001 and September 2002. Dr. Jupiter never opined as to the cause of the plaintiff's arthritis. Id. The records of his care and treatment of the plaintiff are completely devoid of any mention of the cause of the plaintiff's arthritic condition. Likewise, Dr. Jupiter never, before October 10, 2005, mentions that the plaintiff has incurred a 20% permanent partial disability of the right wrist. Dr. Jupiter never even implied that the plaintiff's injuries may have been causally related to his employment with the defendant. Since September 2002, the plaintiff has seen Dr. Jupiter for routine check-ups twice. <u>Id</u>. Consistent with his previous treatment, Dr. Jupiter, at these most recent appointments, neither discussed nor opined on the cause of the plaintiff's injuries. Id.

It is also important to note that trial in this case was originally scheduled to begin on September 19, 2005. At that time the plaintiff, who has (unlike the defendant) been represented by the same counsel since the beginning of this case in 2002, had not yet identified any expert liability witness. The first time the potential of Dr. Jupiter giving

expert opinions on causation and prognosis surfaced was more than one (1) month later (in the October 25, 2005 letter). This was the first notice that the defendant ever received regarding the plaintiff's intention to use Dr. Jupiter for these purposes. This letter was sent more than ten (10) months after the Court's expert disclosure deadline. Therefore, the plaintiff should not be allowed to use Dr. Jupiter as an expert witness. This precludes Dr. Jupiter from offering any opinions on causation and prognosis.

The plaintiff has also, with respect to Dr. Jupiter, failed to comply with Fed. R. Civ. P. 26 (a)(2). Neither Dr. Jupiter's October 10, 2005 letter to plaintiff's counsel, nor plaintiff's October 25, 2005 letter to defendant's counsel, comply with the requirements of expert disclosure under Rule 26. Rule 26 requires a written report prepared and signed by the expert witness, the qualifications of the witness, a list of the witness' publications, the compensation received by the witness and a list of testimony that the witness has given in the last four (4) years. Fed. R. Civ. P. (a)(2)(B). Pursuant to Fed. R. Civ. P. 26 (a)(2)(C), these disclosures shall be made in accordance with the Court's order. To date, none of these requirements have been met. As discussed *supra*, the plaintiff has missed the Court's deadline for expert disclosure by nearly a full year.

Moreover, Rule 26 (a)(2)(C) requires, absent deadlines set by the court, that expert disclosures shall be made at least ninety (90) days before the trial date. The trial of this case is scheduled for January 23, 2006. The plaintiff has therefore missed the ninety (90) day deadline imposed by the Rule. On these grounds as well, the plaintiff should be foreclosed from eliciting opinion testimony from Dr. Jupiter.

The plaintiff has not disclosed Dr. Jupiter as an expert nor has he provided the required Rule 26(a) disclosures and therefore, Dr. Jupiter should be excluded from

Filed 12/30/2005

testifying about opinions which were neither developed nor expressed during the normal course of his care and treatment of the plaintiff, including but not limited to, the cause of the plaintiff's injuries.

B. The Plaintiff Has Also Failed To Meet Rule 26's Disclosure Requirements With Respect to Mr. Andres:

The plaintiff has also failed to properly disclose Mr. Andres. To date, the plaintiff has failed to provide any report authored by Mr. Andres, and has also failed to provide any of the other information required by Rule 26. It is now less than ninety (90) days before trial and the Court's disclosure deadlines have long since passed. The defendant is now left in the position of not having any idea what Mr. Andres might say at trial. The rules are designed to prevent this. Thus, Mr. Andres should not be allowed to testify at trial.

C. The Opinions of Each of the Plaintiff's Expert Witnesses Are Inadmissible Because They Do Not Meet The Requirements of Rule 702 and Daubert:

The plaintiff must present reliable, admissible evidence that the arthritis he allegedly sustained was caused by the defendant's negligence. The plaintiff intends to prove causation via the testimony of his expert physician, Dr. Jupiter, and Mr. Andres. Both of these experts should be precluded from testifying because their conclusions and opinions fail to meet the requirements of Fed. R. Evid. 702 and the standards established by the Supreme Court in <u>Daubert v. Merrill-Dow Pharmaceuticals</u>, Inc., and its progeny. 509 U.S. 579.

1. The Admissibility Of Expert Testimony Under Rule 702 and <u>Daubert</u>:

Fed. R. Evid. 702 governs the admissibility of expert testimony:

[i]f scientific, technical, or other specialized knowledge will assist the trier of fact to understand the evidence or to determine a fact in issue, a witness qualified as an expert by knowledge, skill, experience, training, or education, may testify

8

thereto in the form of an opinion or otherwise, if (1) the testimony is based upon sufficient facts or data. (2) the testimony is the product of reliable principles and methods, and (3) the witness has applied the principles and methods reliably to the facts of the case.

Fed. R. Evid. 702.⁴ Rule 702 generally embodies the following factors, which were established by the Supreme Court in Daubert, that a trial judge must consider when considering the admissibility of expert testimony:

(1) whether the expert's technique or theory can be or has been tested - that is. whether the expert's theory can be challenged in some objective sense, or whether it is instead simply a subjective, conclusory approach that cannot reasonably be assessed for reliability; (2) whether the technique or theory has been subject to peer review and publication; (3) the known or potential rate of error of the technique or theory when applied; (4) the existence and maintenance of standards and controls; and (5) whether the technique or theory has been generally accepted in the scientific community.

Fed. R. Evid. 702, Advisory Committee Notes to the 2000 Amendments; see also Daubert, 509 U.S. at 591-95.5

In Daubert, "the Court charged trial judges with the responsibility of acting as gatekeepers to exclude unreliable expert testimony." Fed. R. Evid. 702, Advisory Committee Notes to the 2000 Amendments. When faced with the proffer of expert testimony under Rule 702, the trial judge, pursuant to Rule 104(a), must make a preliminary assessment of whether the testimony's underlying reasoning or methodology

9

⁴ Rule 702 and Daubert govern the admissibility of expert testimony in FELA cases: "[t]he standard of causation under the FELA and the standards for admission of expert testimony under the Federal Rules of Evidence do not affect one another." Claar v. Burlington Northern Railroad Co., 29 F.3d 499, 504 (9th Cir. 1994); see also Eggar v. Burlington Northern Railroad Co., 1991 U.S. Dist. LEXIS 19240 (D. Montana 1991) ("The evidentiary standards for evaluating the admissibility of expert testimony are not modified by the standard of proof in FELA cases").

⁵Additional factors for analyzing the reliability of opinion testimony have since been identified. See, e.g. Daubert v. Merrill Dow Pharmaceuticals, Inc., 43F.3d 1311, 1317 (9th Cir. 1995) (whether an expert is "proposing to testifying about matters growing naturally and directly out of research they have conducted independant of the litigation, or whether they have developed their opinions expressly for purposes of testifying,"); Claar, 29 F.3d 499 (whether the expert has accounted for obvious alternative explanationstestimony excluded because the expert failed to do so); see also In re: Paoli Railroad Yard PCB Litigation, 35 F.3d 717, 742 at n. 8 (3rd Cir. 1994).

is scientifically or technically valid and properly can be applied to the facts at issue.⁶

Daubert, 509 U.S. at 592-93. The Court in Daubert reasoned that an expert's opinion must be based on "methods and procedures of science," rather than on "subjective belief or unsupported speculation." Daubert, 509 U.S. at 592-93.

The more subjective and controversial the expert's inquiry, the more likely the testimony should be excluded as unreliable. *See* O'Conner v. Commonwealth Edison

Co. 13 F.3d 1090 (7th Cir. 1994). An expert's opinion cannot be based solely on the weight of his own authority: "[n]othing in either Daubert or the Federal Rules of Evidence requires a district court to admit opinion evidence that is connected to existing data only by the *ipse dixit* of the expert." Polaino v. Bayer Corporation, 122 F. Supp. 2d 63, 67 (D. Mass. 2000). "The expert must explain precisely how [he] went about reaching [his] conclusions and point to some objective source...to show that [he has] followed the scientific method, as it is practiced by (at least) a recognized minority of scientists in [his] field." Lust v. Merrell Dow Pharmaceuticals, Inc, 89 F.3d 594 (9th Cir. 1996), citing Daubert, 509 U.S. at 592-93.

2. Any Opinion That So-called "Repetitive Stress" Injuries Can Be Caused by Any Occupational Task Is Inadmissible Since This Relationship Is Neither Generally Accepted in the Relevant Medical Community Nor Is Any Opinion on this Issue Based on Reliable Scientific Methodology:

The cause of repetitive stress illness is a controversial subject about which very little is generally accepted in the medical community. Reports (for instance, a National Institute for Occupational Safety and Health ["NIOSH"] report published in 1997 entitled

⁶Under Rule 104(a), the proponent has the burden of establishing that the pertinent admissibility requirements are met by a preponderance of the evidence. *See* <u>Bourjaily v. United States</u>, 483 U.S. 171 (1987).

Musculoskeletal Disorders and Workplace Factors) have suggested that some occupations expose workers to certain "risk factors" which have been associated with a higher incidence of repetitive stress illnesses in these occupations. However, there are no peer-reviewed articles of controlled studies which conclusively prove this relationship.

In fact, most such studies reach the opposite conclusion. 8

Most importantly, there has been no "dose-response" relationship demonstrated in any peer-reviewed, controlled, published study establishing a "threshold phenomenon" pertaining to any of these "risk factors" above which an individual in any occupation will develop a repetitive stress illness. Mr. Andres has recently admitted that "quantified dose-response information is not available." See Mr. Andres' Report in the Matter of Bashant et al. v. Metro-North Commuter Railroad, a copy of the relevant excerpt of which is attached as Exhibit "I," at p. 8. Mr. Andres has also admitted that no dose-

⁷These "risk factors" are force, repetition, vibration, awkward posture and cold.

⁸See, e.g., Yokum, David, The Many Faces of Carpal Tunnel Syndrome, ARCHIVES OF INTERNAL MEDICINE, vol. 158, p. 1496 (July 27, 1998) ("There remains a great deal of controversy in terms of CTS' cause and relationship to work-related problems. In fact, most studies have not found an association between idiopathic CTS and upper extremity usage..."); Rayan, Gnazi M. Understanding and Managing Carpal Tunnel Syndrome The Journal of Musculoskeletal Medicine, vol. 16, p. 654-663, at p. 657, (Nov. 1999) ("The role of occupational activities alone in causing CTS is controversial and remains inconclusive."); Nathan, Peter A. et al., Obesity as a Risk Factor For Slowing of Sensory Conduction of the Median Nerve in Industry, Journal of Occupational Medicine, vol. 34, no. 4, p. 379 - 383, at p. 379 (April 1992) ("individual characteristics, not job-related factors, are the primary determinants of slowing sensory conduction of the median nerve and carpal tunnel syndrome."); Schottland, John R. et al., Median Nerve Latencies in Poultry Processing Workers: An Approach to Resolving the Role of Industry "Cumulative Trauma" in the Development of Carpal Tunnel Syndrome, JOURNAL OF OCCUPATIONAL MEDICINE, vol. 33, no. 5, at p. 627-631, at p. 627 (May 1991) ("Our data provide very little evidence for the concept of cumulative trauma as a prominent cause of carpal tunnel syndrome in American industry"). If requested, defense counsel will make copies of these articles available for the Court to review.

⁹A "dose-response relationship" is defined as "[a] relationship in which a change in amount, intensity, or duration of exposure is associated with a change - either an increase or a decrease - in risk of disease." *Reference Manual on Scientific Evidence,* The Federal Judicial Center (1994) at p. 174. A "threshold phenomenon" is "[a] certain level of exposure to an agent below which disease does not occur and above which disease does occur." <u>Id.</u> at p. 178.

response relationship between the risk factors and any occupation <u>in the railroad industry</u> has been established - he recently testified, in another case, ¹⁰ as follows:

- Q. I'm asking are you aware of any scientific study, whether by the railroad or any source, that quantifies the risk factors that are encountered in the railroad industries.
- A. ...not that I am aware of.
- Q. Is there any peer reviewed literature that you are aware of that quantifies the optimal amount repetition that an employee in the railroad can have in any particular task?
- A. ...not that I have seen.
- Q. Same question, any type of study concerning awkward postures, that you are aware of, scientific study that's been submitted to peer review where it states the optimal amount of awkward posture that a railroad employee should be subjected to.
- A. ...even in the research literature that is not related to railroads, again, we don't have an equation for any particular individual that says that this much repetition is just enough and if you go just beyond this then it's too much. That's the type of dose response relationship information we don't have.
- Q. Do you have any dose response information concerning the tasks that are performed by the 15 employees that are involved in this case, for the different tasks that they perform.
- A. Again, since we don't have an equation that directly relates the dose to the adverse health outcome, I would have to say that I don't have an equation like that. I haven't seen anything like that published.

See deposition of Mr. Andres in the <u>Pretter</u> case, a copy of the relevant excerpt of which is attached as Exhibit "J," at p. 69-71. Mr. Andres has also admitted that there is no doseresponse relationship pertaining to any of the tools that railroad workers use. Id. at p. 81.

¹⁰Dr. Andres was retained by the plaintiff in the case of <u>Pretter v. Metro North Commuter R. Co.</u>, which involved fifteen railroad workers who claimed they had incurred carpal tunnel syndrome as the result of their various railroad occupations. The trial judge in <u>Pretter</u> excluded Dr. Andres from testifying, essentially on the same grounds which are argued herein. <u>See Pretter v. Metro North Commuter R. Co.</u>, 206 F. Supp. 2d 601 (S.D.N.Y. 2002).

The state of the medical evidence today strongly refutes the causal relationship between any type of railroad work and repetitive stress illnesses. The only peer-reviewed, controlled study of the causal relationship between railroad work and repetitive stress illnesses was completed in February 2002 by a team led by Dr. James L. Cosgrove of the University of Pittsburgh Medical Center Department of Physical Medicine and Rehabilitation. *See* Cosgrove, James L., et al., *Carpal Tunnel Syndrome in Railroad Workers*, JOURNAL OF PHYSICAL MEDICINE & REHABILITATION, vol. 81(2), p. 101-107 (February 2002), a copy of which is attached as Exhibit "K." The Cosgrove study definitively proves that "occupational classification was not associated with the presence of CTS." Id. at p. 105. It is particularly significant that the individuals who were the subject of the Cosgrove study were randomly selected from a pool of 2,500 railroad workers who had actually filed claims against their railroad employers, just like the plaintiff here. Id. at p. 101.¹¹

It is clear, in the wake of the Cosgrove study, that there is no causal relationship between railroad activities and the development of repetitive stress illnesses. Any claim otherwise, by the plaintiff and/or his experts in this or any other FELA case, is, at best, unreliable, certainly specious, and, perhaps, fraudulent. There is simply no basis for an expert, in this or any other case, to opine that the plaintiff's work-related activities caused his arthritis. Any opinions attempting to link the plaintiff's illness to his work activities

1

¹¹ Three other points established by the Cosgrove study are particularly important. First, the study classified subjects into groups according to the strenuousness of the type of occupational activities each subject performed and found that "there was no trend of increased findings of CTS" even in "the groups with higher ergonomic stress." Exh. K at p. 105. The Cosgrove study also found that more than half (56.5%) of the study population (who had been diagnosed as having CTS by their attorneys at "screening events," and filed claims based thereon) actually did not have CTS at all. Id. It is perhaps even more shocking that one-third of the claimants who had undergone surgery did not actually have CTS. Id.

fail to meet the requirements of Rule 702 because they are not "the product of reliable principles and methods."

Dr. Jupiter's October 10, 2005 letter is completely devoid of any foundation for his conclusion that the plaintiff's arthritic condition was "precipitated by his work." He makes no mention of any report or study that supports his conclusory observation. He does not discuss, in any way, shape or form, the requisite dose-response relationship. there is no support for his opinion other than his own ipse dixit. Therefore, even if this Honorable Court finds that Dr. Jupiter and Mr. Andres were not untimely or indadequately disclosed, their testimony must nevertheless be excluded for failure to comply with Fed. R. Civ. P. 702 and/or Daubert.

It is clear that Dr. Cosgrove has recognized the ramifications of plaintiffs' lawyers and their cadre of experts creating unreliable medical diagnoses for the sole purpose of fostering litigation:

...it must be recognized that there are clear societal implications for the current practice in screening for CTS. Declaring an individual as having CTS has profound effects on feelings of health and well-being, employee-management relations, legal proceedings, and medical procedures. It is incumbent on electromyographers to employ rigorous and appropriate standards in the performance of carpal tunnel evaluations. At present, the association of carpal tunnel syndrome with hand activities remains unproved. It may be that with CTS as with many of the other medical and legal issues of our time, "litigation, fear, bias, and greed interfere with scientific efforts to answer questions of importance to the public health and that antiscientific social attitudes encourage premature or ill-informed political and legal solutions to medical questions."

Exh. K at p. 105-106 (citation omitted). The defendant asks the Court to reach the same conclusion in this case by striking the plaintiff's experts.

3. The Expert's Opinions Are Not Based On "Sufficient Facts or Data" Or Principles and Methods Which Have Been Applied Reliably To This Case:

Even if the plaintiff's experts are allowed to testify that occupational activities can cause repetitive stress illnesses, their opinions are nevertheless inadmissible because they are not based on "sufficient facts or data" specific to this case nor have they applied any "principles and methods reliably to the facts of" this case. Courts have consistently excluded experts in repetitive stress cases where their opinions are not based on sufficient facts or data due to the expert's failure to adequately investigate the plaintiff's actual work history, personal risk factors and potential other causes. ¹² The plaintiff's experts here have failed to fulfill these requirements.

Simply put, Dr. Jupiter's "opinion" on causation is deficient on its face and should be summarily excluded. He does not even attempt to describe

_

15

See Dukes, 934 F. Supp. 939 (expert physician precluded where his opinions that the plaintiff's carpal tunnel syndrome was work-related were reached by "talking with the plaintiff and reviewing information;" the expert performed no independent studies nor received any research in reaching those conclusions nor could he articulate any technique by which his conclusions could be scientifically and objectively tested): Bennett v. PRC Public Sector, Inc., 931 F. Supp. 484 (S.D. Tex. 1996)(ergonomist precluded from offering opinions that plaintiffs' upper extremity disorder was caused by defendant's computer system where expert did not meet or interview plaintiffs, did not analyze potential work-related causes, did not know quantity of keystroking per day, forces involved or breaks available throughout day, did not know when and for how long plaintiffs used equipment, did not consider personal risk factors, did not investigate personal work or medical histories, did not interview physicians, made no attempt to exclude other causes, made no attempt to study the statistical frequency of upper extremity disorders in the particular work force or compare it with other groups); Reiff v. Convergent Technologies, 1997 WL 93750 (D.N.J. 1997) (plaintiffs' expert ergonomist and physician testimony did not meet Daubert standards for "sound" methodology); Dennis v. Pertec Computer Corporation, 92 F. Supp. 156 (D.N.J. 1996) (first ergonomist opinion excluded where he could not define methodology beyond stating that "certain factors were probably in the back of my mind;" second ergonomist excluded where he failed to consider type of keyboard used by plaintiffs or maintenance and repair of those keyboards as well as inability to describe methods used on a "representative" keyboard); Spears v. Unisys Corporation, 1995 U.S.Dist. Lexis 8745 (E.D. Mich. 1995) (plaintiff's ergonomist barred from offering opinions on causation in carpal tunnel case as he did not test his opinions, did not subject them to peer review and based his opinions on "minimal factual investigation"); Claar, 29 F.3d 499 (where, through affidavits, physicians offered their conclusions that the plaintiff's injuries were caused by exposure to chemicals, the Ninth Circuit affirmed the trial court finding that the affidavits were inadmissible as they failed to explain the basis for the opinions and the doctors' reasoning and methods in reaching them).

any basis for his "opinion" that the plaintiff's work activities "precipitated" his arthritis. He fails to identify the plaintiff's specific job activities or indicate that he is even familiar with the plaintiff's job activities. There is no indication that he ever even observed the plaintiff's work activities. Nor does he mention any specific quantifications or measurements of the physical activities the plaintiff performed in any of his jobs. Dr. Jupiter fails to even identify the specific ergonomic "risk factors" or state that any of them were present in any of the plaintiff's jobs. He also fails to describe any methodology by which he reached his conclusions.

Dr. Jupiter makes a legally impermissible leap by simply concluding without any scientific analysis or data, without any reliable methods or principles, and without applying any principles to the facts of this case, that the plaintiff's job activities "precipitated" his arthritis. This is the precise type of scientific conclusion that Daubert intended to preclude: a medical opinion as to causation based merely upon the "ipse dixit" of the expert. Accordingly, since this "opinion" fails to meet the requirements of Daubert and Rule 702, Dr. Jupiter's testimony on this issue must be excluded.

Mr. Andres must face the same fate. Although (because the plaintiff has failed to produce a report from Mr. Andres) it is unclear precisely what his testimony will be here. in a similar case, Pretter v. Metro North Commuter R.R. Co., Judge Rakoff of the U.S.D.C. for the Southern District of New York, recently precluded Dr. Andres from testifying to opinions similar to those he is expected to proffer in the case at hand. 206

F.Supp.2d 601 (2002).¹³ In rejecting Dr. Andres' "medical causation" opinion, Judge Rakoff ruled that:

(the) opinion suffers from...fundamental flaws that render it inadmissible under Daubert...in its stated form the opinion is so vague as to be meaningless. What does it mean for a job to "expose" a worker to sufficient amounts of ergonomic risk factors to be "consistent" with the development of CTS? More fundamentally,...this vagueness is not the result of imprecise wording, but of imprecise methodology and inadequate investigation. For example, even though...Dr. Andres testified that the two "ergonomic risk factors" most applicable to plaintiff's work were frequent repetitions and the exertion of high levels of force, he neither defined these factors with specificity nor offered any objectively measured evidence of the frequency with which Metro North employees repeated their job functions or the level of force they employed....Instead he chose to rely on impressions and extrapolations derived from his brief and casual inspection and videotaping of the work functions at issue...substantially closer observation and quantitative measurement would be necessary before his opinion...could meet the most elementary requirements of "scientific certainty," such as precision, reliability, and falsifiability.

Pretter, 206 F.Supp.2d at 603-604, *citing* Daubert, 509 U.S. at 591-95,113 S. Ct. 2786. Noting Dr. Andres himself acknowledged that reliance on subjective "data" is problematic in reaching "scientific" conclusions, Judge Rakoff also determined that the deficiencies in Dr. Andres' methodology were:

exacerbated, rather than cured, by the only "empirical" data on which (he) relied, to wit, plaintiffs' own vague, conclusory, and self-serving statements....One who seeks to clothe his opinions in the garb of "scientific certainty" must adhere to the strict standards of objectivity that the formal wear entails.

Id. at 604.

In the case at hand, Dr. Andres has been denied access to the plaintiff's jobsite and has therefore not made any observations of the plaintiff's job activities. He has failed to measure any of the physical factors associated with these activities, such as force,

¹³ <u>Pretter</u> involved fifteen plaintiffs who filed FELA actions against the Metro North for allegedly work-related CTS. 206 F. Supp. at 602. Dr. Andres submitted a Report detailing several opinions. The Report, the conclusions and opinions expressed therein and the methods Dr. Andres employed in <u>Pretter</u> were all virtually the same as in the case at hand. <u>Id</u>.

repetition or posture. He therefore has again (as was the case in <u>Pretter</u>) failed to take any quantitative measurements of the "risk factors." He also has been rendered unable to conduct a detailed analysis or use any methodology that can be tested or subjected to peer review and publication. As a result, Mr. Andres simply cannot apply any scientific method to arrive at an opinion on causation in this case. Thus, his testimony should be excluded.

WHEREFORE, for all of the above-stated reasons, National Railroad Passenger

Corporation's Motion In Limine To Preclude The Testimony Of The Plaintiff's Expert

Witnesses should be allowed.

REQUEST FOR HEARING

In accordance with Local Rule 7.1(D), the defendant believes that oral argument, if necessary, may assist the Court and wishes to be heard and therefore requests that the Court schedule a hearing on its *Motion*.

CERTIFICATE OF SERVICE

I hereby certify that I served a copy of the foregoing pleading on all parties by hand/mail delivering same, to all counsel of record.

Signed under the pains and penalties of perjury.

EXHIBIT A

JOSEPH DIBENEDETTO MGH: 093-63-99 August 20, 1999

Diagnosis: epithelioid spindle cell hemangioma right upper extremity. **Status-post:** resection of tumor and right axillary artery aneurysm 11/95; right lateral epicondylitis; history of DVT.

Mr. DiBenedetto has had a one week history of pain in his right arm, which is quite severe. It is aggravated with activities like swinging a hammer. He does not know what brought this on and does not recall any injury. He is concerned because this is the area of his prior tumor.

On examination he has no tenderness to palpation in his right deltoid area. He has full range of motion but has some pain with getting his arm behind his back and resistive motions of his hand and wrist cause pain. He is neurologically intact to light sensation and all major motor groups in the upper extremities are 5/5, although he has some pain when attempting to perform these maneuvers.

Repeat radiographs show no new bony abnormalities or soft tissue masses that I can see.

Impression/Plan: I suspect that this is an overuse type of syndrome and is unrelated to his tumor but in light of his tumor history I think we should repeat an MRI. It sounds like his symptoms are significant enough that he needs to rest this and take some anti-inflammatory agents. I will give him a note saying that he will need to be out of work for about ten days until we have a chance to review the MRI.

Mark C. Gebhardt, M.D.

ADDENDUM: He did meet with Dr. Siliski and according to the patient a high tibial osteotomy was recommended for medial joint line arthritis. This sounds very reasonable and I think if he wants to go ahead with that he can set that up with Dr. Siliski.

		53			55
1		MR. FLYNN: Don't coach him.	1	A	Sometimes I did. Best I can recall.
2		MR. PALERMO: I'm not five, six months	2	Q	Would it go up your radius like you've described
3		before	3		earlier?
		MR. FLYNN: Hold on. Hold on.	4	A	I don't remember it doing that though.
, <i>i</i>		MR. PALERMO: He described it	5	Q	That would be as a result of your hammer banging
6		MR. FLYNN: You could object. But to bring	6		on something, correct?
7		in the statute that's a blatant attempt to coach	7	A	Yes.
8		this witness and he has said	8	Q	How many times prior to December of 2000 had you
9		MR. PALERMO: You're making a blatant	9		experienced that tweaking?
10		MR. FLYNN: Hold on. He has said	10	Α	I don't recall.
11		MR. PALERMO: Now, listen, you're making a	11	Q	Was it more than once?
12		blatant attempt to get him to say tweaking	12	A	I don't recall at all.
13		MR. FLYNN: No. He said tweaking.	13	Q	Was it more than a dozen times?
14		MR. PALERMO: You went right to August '99.	14	A	I don't recall.
15		Where did you pull that from? That's three	15	Q	Have you always had the same shift since you
16		months before this complaint was filed.	16		became a Carman?
17		MR. FLYNN: He, he said tweaking	17	A	No.
18		spontaneously. It's his words and I'm just	18	Q	It's been changed from time to time?
19	•	asking him.	19	A	I've mostly been on midnight to eight.
20		MR. PALERMO: And he just said I didn't have	20	Q	Midnight to eight?
21		any dates.	21	A	Yes.
22		MR. FLYNN: No. He said he doesn't want to	22	Q	Were you on midnight to eight in December of
23		guess.	23		2000?
24	Q	So what's your best estimate	24	A	I believe I was.

1		hammering that's when you started to feel these	1		it's progressed, right?
2		symptoms in your wrist?	2	A	Yes.
3	A	Well I noticed it more after the first surgery.	3	Q	He was calling it arthritis, correct?
,	j	It was definitely something	4	A	I don't remember what he was calling it.
1	/ Q	Do you agree with me, sir, that earlier in this	5	Q	You've looked at his reports, right?
6		deposition under oath you told me that you first	6	A	Yeah, but I don't remember everything that's on
7		started to recognize the symptoms in December of	7		the reports. I have a terrible memory as it is.
8		2000, about six months before you saw Dr. Jupiter	8	Q	But you've been to a lot of doctors and you've
9 ا		because when you were hammering at work you were	9		communicated with a lot of doctors, right?
10		feeling pain, numbness and tingling in your	10	A	But that doesn't make me a medical person.
111		wrist? You told us that earlier, didn't you?	11	Q	I understand that.
12	A	I'm not sure.	12	A	I could read a report, but I don't understand
13	Q	You don't remember now?	13		everything that's in that report.
14	A	No. I'm not sure if I did say that.	14	Q	You've read the reports and you know that Dr.
15	Q	Well you certainly knew that	15		Jupiter has described your condition as
16	A	It's been a long day already.	16		arthritis, correct?
17	Q	I understand that. But you went to see Dr.	17	A	I don't remember that.
18		Jupiter because you were having that pain in your	18	Q	Well he's never used the term Carpal Tunnel
19		wrist, right?	19		Syndrome, has he?
20	A	Yes.	20	A	I don't know if he is.
21	Q	That was being brought about by hammering, was it	21	Q	Well do you know if he has or not?
22		not?	22	Α	I don't know if he has.
23	A	I'm sure it was.	23	Q	Do you know of any doctor in your case who's ever
24	Q	So you knew that by the time you had the first	24		described the condition in your right wrist as

Plaintiff

vs.

JURY TRIAL DEMAN

SUMMONS ISSUED
LOCAL RULE 4.1

WAIVER FORM_____

BY DPTY CLE

M.OT

Defendant

NO.

CIVIL ACTION

- 1. The Plaintiff, Joseph DiBenedetto, is a competent adult individual residing at 27 Western Avenue, Wakefield, Massachusetts 01880.
- 2. The Defendant, National Railroad Passenger Corporation is a corporation organized and existing under the laws of the District of Columbia, doing business at and whose address for service of process is 253 Summer Street, Boston, Massachusetts 02210.
- 3. This suit is brought pursuant to an Act of Congress known as the Federal Employers' Liability Act (F.E.L.A.), 45 U.S.C. §§51-60; the Federal Safety Appliance Acts, 45 U.S.C.§§1-16; and the Boiler Inspection Acts, 45 U.S.C.§§22-34.
- 4. At all times material hereto, the Defendant, National Railroad Passenger Corporation, was engaged in interstate commerce as a common carrier by railroad operating a line and system of railroads in the State of Massachusetts and other states of the United States.

- 5. At the time and place hereinafter mentioned, the acts of omission and commission causing injuries to the Plaintiff was done by the Defendant, its agents, servants, workmen and/or employees acting in the course and scope of their employment with and under the direct and exclusive control of the Defendant.
- 6. At the time and place hereinafter mentioned, the Plaintiff was employed by Defendant railroad and was acting in the scope of his employment by Defendant and was engaged in the furtherance of interstate commerce within the meaning of the F.E.L.A.
- 7. All the property, equipment and operations involved in this occurrence hereinafter referred to were owned and/or under the direct and exclusive control of the Defendant, its agents, servants, workmen and/or employees.
- 8. The Plaintiff has been employed by the Defendant from July 14, 1976 through and including the present as a carman, and, while working within the scope of his employment in and around Boston, Massachusetts, was exposed to occupational risk factors for carpal tunnel syndrome, including but not limited to repetition, force, vibration and awkward wrist posture.
- 9. Plaintiff's injuries were caused in whole or in part by the negligence, carelessness and recklessness of the Defendant and its agents, servants, workmen and/or employees, acting within the scope of their employment, which negligence consisted of the following:
 - a) failure to provide the plaintiff with a safe place to work as required by the Federal Employers' Liability Act, 45 U.S.C. §§51-60; the Federal Safety Appliance 45 U.S.C. §§1-16; and the Boiler Inspection Acts, 45 U.S.C. §§22-34.

failure to provide a timely and adequate ergonomic program designed b) to prevent occupational carpal tunnel syndrome;

Document 20

- failure to comply with safety and operating rules and regulations of the c) Defendant;
- forcing the Plaintiff to work under hurried and/or awkward conditions; d)
- negligence of the Defendant's agents, servants, workmen and/or e) employees; and
- negligence at law; and f)
- otherwise failing to exercise due and adequate care under the g) circumstances including, but not limited to, a lack of adequate manpower.
- As a direct result of the Defendant's negligence, through its agents, servants, 10. workmen and/or employees, the Plaintiff suffered occupational carpal tunnel syndrome.
- The Plaintiff was diagnosed with occupational carpal tunnel syndrome which 11. required surgery.
- As a direct result of the Defendant's negligence, through its agents, servants, 12. workmen and/or employees, the Plaintiff has been unable to attend to his usual duties and occupations, all of which caused substantial financial loss and all of which may and probably will continue in the future.
- As a direct result of the Defendant's negligence, through its agents, servants, 13. workmen and/or employees, the Plaintiff has been and may continue to be required to receive and undergo medical treatment and medical care, including surgery, and has incurred

reasonable and necessary medical expenses, all of which may and probably will continue in the future.

- As a direct result of the Defendant's negligence, through its agents, servants, 14. workmen and/or employees, the Plaintiff has sustained pain, suffering, inconvenience, stress and a loss of enjoyment of life and may continue to suffer same for an indefinite period of time in the future.
- The Defendant has a duty to provide a reasonably safe place to work. It had 15. a non-delegable duty to insure that the Plaintiff had adequate qualified assistance to perform the functions of his work without unnecessary risk of injury to himself. The Defendant has a duty to provide a sufficient number of employees to perform assigned work, and its failure to provide adequate assistance can be a breach of its duty to provide a safe place for the Plaintiff to work, and will entitle the Plaintiff to a recovery against the Defendant if any such failure was a cause, in whole or in part, of the injuries claimed by the Plaintiff.

WHEREFORE, the Plaintiff demands judgment against the Defendants in an amount in excess of ONE HUNDRED FIFTY THOUSAND DOLLARS, (\$150,000.00).

DIBENEDETTO, JOSEPH J MGH # 093-63-99

Mary Ann Kieney c/o Hannon & Joyce Law Office Public Ledger Building Suite 1000 150 South Independence Mall West Philadelphia, PA 19106-3413

Dear Ms. Kieney,

I initially saw Mr. DiBenedetto on March 27, 2001, for a pain in the radial side of his right wrist. He was referred by Dr. Mark Gebhardt, a colleague at the Massachusetts General Hospital. It was unclear whether or not there was an acute injury, but he was very active in his job with the railroad and had repetitive traumatic events.

I learned his past medical history was of importance and that he was on anticoagulations for a lower extremity venous problem, and medication for hypertension.

My initial examination demonstrated substantial discomfort over the radial styloid area of his right wrist.

Radiographs at that time showed a large spur arising off of the scaphoid bone, and what appeared to be a small avulsion off of the radial styloid.

The initial impression was that of localized arthrosis with an avulsion fracture, the date of which was unclear, off of the radial styloid.

On May 4, 2001, he underwent an excision of the spur off of the scaphoid and the radial styloid as well. We found at surgery a substantial loss of articular cartilage off of the scaphoid. Postoperatively, he underwent an organized rehabilitation program and regained a reasonable degree of grip strength, noting on October 2, 2001, his strength was 35 kilograms compared to 47 on the opposite, and pinch of 28 pounds compared to 34 pounds. He had regained his motion and felt capable of returning to work.

He continued, however, to have pain and swelling. A conticosteroid injection was given in the wrist in November 2001, and a splint prescribed.

Document 20

Because of ongoing problems and advancing intercarpal arthritis, he underwent a proximal row carpectomy on February 4, 2002. At that time, a substantial degree of arthrosis was noted, as well as a massive amount of fluid and synovitis. There was no figurent noted between the scaphoid and imate.

An organized rehabilitation program was constructed and he ultimately returned to work in September 2002.

He was seen again on August 5, 2004, noting that he was still working for the railroad, however, was developing more discomfort. There was on examination some crepitation in both radial and ulnar deviation, and x-rays continued to show the alignment postsurgical to be intact. A firmer splint was prescribed.

Mr. DiBenedetto returned May 10, 2005, still having occasional discomfort. At that time, his examination showed an extension of the wrist of 40 degrees, flexion of 25 degrees, radial and ninar deviation of 10 degrees each. He had a grip strength of 90 pounds versus 120 on the opposite side, which was similar to an examination two years before. X-rays showed no advancing arthrosis. Mr. DiBenedetto was scheduled to return in one year.

In summary, Mr. Joseph D. DiBenedetto had been evaluated and treated for intercarpal arthritis of his right dominant wrist. The symptoms appear to be precipitated by events that occurred while in his employment. He presented initially with what appeared to a chip fracture off the radial styloid associated with intercarpal arthritis. He ultimately required two surgical procedures, and is left with a permanent partial disability of 20% of his dominant wrist. It is possible that he will require additional surgery in the future.

Thank you very much.

Sincerely yours,

Jesse Jupife Jesse B. Juliter, M.D.

Dear Mr. Young:

Enclosed please find the Military Records authorizations, which you previously forwarded me with regard to the above-referenced matter. In addition, as a supplement to Plaintiff's Answers to Defendant's Interrogatories, enclosed please find the expert narrative report of Jesse B. Jupiter, M.D. dated October 10, 2005.

Kindly contact me upon receipt of this letter to discuss the scheduling of the Plaintiff's deposition.

Thank you for your courtesy and cooperation.

Very truly yours,

DON P. PALERMO

UNITED STATES DISTRICT COURT DISTRICT OF MASSACHUSETTS

JOSEPH J. DIBENEDETTO, Plaintiff,

VS.

NATIONAL RAILROAD PASSENGER CORPORATION, Defendant. CIVIL ACTION NO.: 04-10570-RCL

NATIONAL RAILROAD PASSENGER CORPORATION'S MOTION FOR LEAVE TO CONDUCT DISCOVERY AND TO POSTPONE THE TRIAL DATE

The defendant, National Railroad Passenger Corporation ("AMTRAK"), hereby moves this Honorable Court to allow AMTRAK to conduct limited discovery in this case and to postpone the current trial date of September 19, 2005. As grounds therefore, the defendant states as follows:

I. FACTUAL BACKGROUND

On March 23, 2004, the plaintiff, Joseph DiBenedetto ("DiBenedetto") filed a *Complaint* against AMTRAK. On April 16, 2004, Attorney Paul Sahovey, in-house counsel for the Massachusetts Bay Transportation Authority ("MBTA"), filed an answer and affirmative defenses on behalf of AMTRAK. AMTRAK has, up until recently, operated the commuter rail service in and around Boston pursuant to various agreements with the MBTA. *See* Affidavit of Rosa T. Richmond, a copy of which is attached as Exhibit "A." As such, many employees worked for both AMTRAK and the MBTA at various times. <u>Id</u>. The amount of service time of an injured employee determined which of the two entities would answer and defend against an

¹ This case had previously been filed in the Philadelphia Court of Common Pleas in Pennsylvania. On October 1, 2003, this matter was dismissed from the Philadelphia Court of Common Pleas. The parties stipulated to a dismissal in light of the defendant's Motion to Dismiss for Forum Non Conveniens and agreed that the plaintiff had until March 25, 2004 to re-file his case in Massachusetts. In the Pennsylvania case, the defendant was represented by

injured employee's lawsuit. Id. The MBTA (Attorney Sahovey) appeared in this case for AMTRAK because it was originally (and erroneously) believed that the plaintiff had worked more for the MBTA than AMTRAK, thereby triggering the MBTA's obligation to defend. Id. Since answering the plaintiff's Complaint and taking over the defense of this litigation, the MBTA has conducted no discovery, except for serving written discovery. Notably, the plaintiff has not been deposed and no expert witnesses have been disclosed.

A pre-trial conference was held in this case on June 9, 2005, at which time the Court stated that no discovery will be allowed in this case and that counsel may mediate the case but there will not be a change in the trial date. Counsel for AMTRAK was substituted on June 22, 2005. AMTRAK respectfully requests that this Honorable Court allow substituted counsel the opportunity to conduct limited discovery and postpone the trial date.

II. ARGUMENT

This Honorable Court should allow AMTRAK's Motion For Leave To Conduct Discovery And To Postpone The Trial Date as AMTRAK, for all intents and purposes, is a new party to this litigation. Exh. A. AMTRAK and the MBTA are separate and distinct entities with differing interests, but have had a long history of business relationships. Id. Up until very recently, AMTRAK operated the states' commuter rail service per various agreements with the MBTA. Id. As a result, employees for both AMTRAK and the MBTA performed services for both entities. Id. The amount of service an employee has performed for either entity determines which entity will appear and defend against claims and lawsuits that such injured employees file against them. Id. When the plaintiff's claim was originally filed, AMTRAK and the MBTA believed that the plaintiff was in service for the MBTA and as a result, counsel for the MBTA

appeared and defended against the plaintiff's claims. Id. The plaintiff has actually performed services for both AMTRAK and the MBTA. Id.

AMTRAK has since discovered that the plaintiff served as an AMTRAK employee for a longer period of time than he did for the MBTA and as a result, AMTRAK is now the entity defending this matter. Exh. A. As a result, counsel for AMTRAK was substituted on June 22, 2005. Although named as the original defendant, for all intents and purposes the defendant AMTRAK is a new party to this litigation and should be allowed the opportunity to conduct limited discovery.

As an entity distinctly separate from the MBTA, AMTRAK utilizes its own litigation strategy and processes for defending claims. More importantly, AMTRAK's interests are different from that of the MBTA and it should be afforded an opportunity to adequately protect these interests. In light of these circumstances, it is necessary for AMTRAK to conduct limited discovery. Specifically, AMTRAK wishes to serve interrogatories and requests for documents upon the plaintiff, depose the plaintiff and any material or expert witnesses that the plaintiff may designate and prepare its own expert disclosures. It is worthy to note that Attorney Sahovey served interrogatories and requests for production of documents upon the plaintiff on April 14, 2004 but the plaintiff has never responded. A copy of these discovery requests are attached hereto as Exhibit "B."

It is apparent from the record that very little discovery has been conducted in this matter. However, it would be unfair and unjust to subject a new party such as AMTRAK to the Court's previous pre-trial order without an adequate opportunity to prepare for trial.

III. CONCLUSION

Document 20

The defendant AMTRAK hereby moves this Honorable Court to allow it to conduct limited discovery in this matter and to postpone the trial date. AMTRAK has not been afforded the opportunity to conduct discovery in this matter and without such opportunity, AMTRAK's interests would be irreversibly prejudiced at mediation and/or trial. In the interests of justice, AMTRAK should be afforded the opportunity to conduct limited discovery in this matter in order to be able to adequately prepare for trial.

WHEREFORE, for all of the above-stated reasons, National Railroad Passenger Corporation's Motion For Leave To Conduct Discovery And To Postpone The Trial Date should be allowed.

REQUEST FOR HEARING

In accordance with Local Rule 7.1(D), the defendant believes that oral argument, if necessary, may assist the Court and wishes to be heard and therefore requests that the Court schedule a hearing on its Motion.

CIVIL ACTION NO.: 04-10570-RCL

AFFIDAVIT OF ROSA T. RICHMOND

I, Rosa T. Richmond, do hereby swear and depose as follows:

- 1. I am a Senior Claims Agent employed by AMTRAK;
- 2. AMTRAK and the MBTA are separate and distinct entities but have a history of business relationships including AMTRAK's operation of the Commonwealth's commuter rail service;
- 3. The plaintiff has performed services for both AMTRAK and the MBTA;
- The amount of service performed for either entity often determines which entity will 4. appear and defend against the plaintiff's claims;
- When the plaintiff's claim was filed, it was originally believed that the plaintiff was in 5. service for the MBTA and as a result, the MBTA appeared and defended against the plaintiff's claims;
- It has come to the attention of AMTRAK that the plaintiff served as an AMTRAK 6. employee for a longer period of time than he did for the MBTA and as a result, AMTRAK is now the entity defending this matter.

SIGNED UNDER THE PAINS AND PENALTIES OF PERJURY THIS 27 DAY OF, JUNE 2005.

kara J. Willimond

The said coments and mentage are to be blocked at the provey. META is a provey. Metage is a provey.

This demand is to include all after-acquired documents and things. The Plaintiff is, therefore, requested to supplement the production of documents and things by forwarding copies to the Defendant Amtrak or putting the Defendant on notice as to any newly acquired material.

REQUESTS

- Copies of all signed and/or unsigned statements or statements recorded by mechanical and/or electronic means, made by the Plaintiff's representative to Defendant Amtrak, and/or insurance companies, which relate to the incident(s) referred to in the Complaint and which are in the possession, custody or control or available to the plaintiff.
- 2. Copies of all signed and/or unsigned statements or statements recorded by mechanical and/or electronic means, made by any witnesses to the alleged accident(s), directly or indirectly, which are in the possession, custody or control of the Plaintiff or subject to his/her control.
- 3. The names and addresses of all persons known to the Plaintiff who were witnesses, either directly or indirectly, to the accident(s) as alleged in your Complaint.
- 4. Photographs or sketches, plans or diagrams, or copies thereof, of the scene of the accident(s) as alleged in your Complaint, the condition of the engine room of the locomotive and/or equipment involved in the accident together with any and all photographs which the Plaintiff intends to offer in evidence at the time of trial.
- 5. Any and all work and wage records, including hourly rate of pay, for a period of ten (10) years prior to the date of each accident(s) as alleged in your Complaint.
- 6. Any accident reports or other reports, either oral or in writing, filed either by the Plaintiff or on the Plaintiff's behalf by his attorney(s) or otherwise for the accident(s) as alleged in your Complaint.
- 7. All medical, hospital or other reports, either written or oral, involving injuries or damages as alleged to have been suffered by the Plaintiff as a result of the accident(s) as alleged in your Complaint; also, any and all bills,

insurance company receipts of payment, together with all canceled checks, evidence of payment and/or cash receipts evidencing payment.

- All medical, hospital, or other reports, either written or 8. oral, involving injury to Plaintiff for a period of three years prior to the date of the accident(s) as alleged in your Complaint and also any and all bills, insurance company reports of payment together with all canceled checks, evidence of payment and/or cash receipts evidencing payment.
- Copies of all state and federal income tax records and . 9. returns which the Plaintiff filed with the federal government, Commonwealth of Massachusetts and county of residence for a period of five (5) years prior to the date of the accident(s) as alleged in your Complaint.
 - Copies of all reports of all expert witnesses in the possession or custody of the Plaintiff or subject to plaintiff's control.
- 11. Copies of all documentary evidence to be used by the plaintiff at the trial of this action including but not limited to public records, if any.
- 12. Copies of any and all plans, diagrams or drawings of the area of the locomotive, engine room, commuter rail station, commuter rail facility, a particular coach, or the general area of the premises where you were working at the time of the accident(s) as alleged in your Complaint.

JOSEPH J. DIBENEDETTO, Plaintiff,

VS.

NATIONAL RAILROAD PASSENGER CORPORATION, Defendant. CIVIL ACTION NO.: 04-10570-RCL

AFFIDAVIT OF JOHN E. YOUNG, ESQ.

I, John E. Young, Esq., do hereby swear and depose as follows:

- 1. I am an attorney duly admitted to practice law in the Commonwealth of Massachusetts and I represent the defendant in the above-entitled matter;
- 2. On July 6, 2005, I contacted Attorney Michael McDevitt, Lawson & Weitzen, LLP, 88 Black Falcon Avenue, Boston, MA 02210, counsel who has appeared on behalf of the plaintiff, to discuss the issues raised in National Railroad Passenger Corporation's Motion For Leave To Conduct Discovery And To Postpone The Trial Date;
- 3. Attorney McDevitt stated that he is local counsel on this case and that I needed to speak with Attorney Thomas Joyce, 150 S. Independence Mall West, Philadelphia, PA 19106 in regards to this matter;
- 4. I called Attorney Joyce and left him a voice mail message on July 6, 2005;
- 5. I faxed Attorney Joyce a letter on July 7, 2005 requesting that he contact me to discuss this matter;
- 6. I called Attorney Joyce on July 11, 2005 and left a message with his assistant explaining my request to confer on this matter;
- 7. I have not heard from Attorney Joyce to date.

SIGNED UNDER THE PAINS AND PENALTIES OF PERJURY THIS 12^{11} DAY OF, JULY 2005.

REPORT IN THE MATTERS OF BASHANT ET AL. V. METRO-NORTH COMMUTER RAILROAD

February 12, 2001

Robert O. Andres, Ph.D., CPE

INTRODUCTION

This is a brief report summarizing my knowledge and opinions in the matters of Thomas Bashant, John Dmytryszyn, Joseph Geiss, George Johnson, Jr., Joseph Juhasz, John Male, Sr., Frank Mastranunzio, Jerry Patterson, Christopher Peck, Patrick Peters, Frank Pretter, Robert Richardson, William Strand, Gregory Stuckart, and Brian Tarpey versus the Metro-North Commuter Railroad (MNCR). The report provides two types of analyses: first, whether these employees were exposed to any ergonomic risk factors during their work with MNCR, and second, what manner of comprehensive safety and health program MNCR had in place to systematically deal with ergonomic issues for their workers.

My analysis of these employees' exposure to ergonomic risk factors will be based on information provided to me in this matter, information from the railroad and associated groups, a site inspection at Harmon Shop on 1/25/01, and previous observations I have made of similar work in other facilities. My evaluation of the actions of MNCR in regard to their treatment of ergonomics issues within their safety and health program will address when a responsible employer should have known about the ergonomic risk factors associated with work related musculoskeletal disorders (WMSDs) and what the responsible employer should have done to reduce risk by removing or reducing exposure to these risk factors. Finally, my conclusions and opinions are presented at the end of the report.

INFORMATION PROVIDED AND REVIEWED

The following materials were provided by Mr. Joyce's office for my review:

Pleadings:

- Plaintiffs' Complaints (15)
- Plaintiff's Answers to Defendant's Interrogatories (15)
- Plaintiff's Answers to Defendant's Demand for Expert Witness Information (15)
- Defendant MNCR Answer to Plaintiff's Interrogatories in James Johnson v. MNCR, dated 7/7/00
- Response to Plaintiff's Requests for Production of Documents in James Johnson v. MNCR, dated 7/7/00

Testimony:

Deposition testimony of Dr. Genevieve Go in Frank Pretter v. MNCR, taken 1/17/01

The concept of an ergonomic risk factor in the case of the upper extremity should be considered the same way it is considered for the development of heart disease. The more risk factors present in a given situation, the greater the risk to the individual. This is important since quantified dose-response information is not available. In the case of heart disease, if a person has a healthy diet, exercises appropriately, has no family history of heart disease, but smokes cigarettes they are at a certain level of risk. However, someone who has a lousy diet, is overweight and sedentary, has a family history of heart disease and also smokes is at a higher level of risk. Likewise with ergonomic risk factors - the more that are present, the greater the level of risk for developing musculoskeletal disorders in the upper extremities or low back.

Epidemiological evidence associates forceful work, hand/wrist vibration, and highly repetitive work with CTS (see Chapter 5 in <u>Musculoskeletal Disorders and Workplace Factors</u>, NIOSH, 1997). At this point in time there is insufficient epidemiological evidence of an association between CTS and extreme postures alone. However, there is strong epidemiological evidence of a positive association between exposure to a combination of risk factors (e.g. force and repetition, force and posture) and CTS.

ERGONOMIC RISK FACTORS ASSOCIATED WITH JOB TASKS

The amount of repetition or the duration of a sustained posture determine the exposure to the other risk factors. Keep in mind that repetition does not have to come from the same task being performed consecutively (such as in assembly line work); the repetition comes from the same musculoskeletal components reacting to similar external forces. It is certainly easier to talk about repetition during assembly line tasks because the external acts are observably repetitive - and for this reason most epidemiological studies which have associated repetitive task performance with WMSD development have come from assembly line type actions (i.e. auto assembly, poultry processing, etc.). Determination of internal exposures to loading (e.g. to tendons, ligaments, muscles, and nerves) requires complex instrumentation and/or analysis. This has yet to be done as part of the exposure assessment with any prospective epidemiological study because of the difficulty and the cost. However, the exposure of the internal tissues of the body to these risk factors is not necessarily unique for each different tool used - for example the use of a spiking maul and a sledgehammer both involve the same risk factors and similar stresses on the musculoskeletal system.

MNCR summarized the duties of machinist in the Maintenance of Equipment Department as follows (approved 2/26/91):

"Inspects, repairs, and maintains air brake systems on all diesel powered equipment and on M-Series equipment on New Haven Div.

Installs and removes major components on diesel equipment including oil engines, main generators, air compressors, APU's, and drive motors

Performs periodic equipment inspections in accordance with Metro-North, state, and federal regulations

Completes required paperwork to comply with federal, state, and Metro-North requirements"

MNCR summarized the duties of machinist in the Grand Central Terminal as follows (approved 11/29/90):

"Fabricates components and tools from steel stock

        that has been submitted for peer review.
  2
  3
                   I guess I need further
  4
        clarification. Are you talking about has
 5
        anybody in the railroad published an
 6
        epidemiological study?
 7
                   I'm asking are you aware of any
            Q
        scientific study, whether by the railroad
 8
 9
       or any source, that quantifies the risk
11.0
        factors that are encountered in the
11
       railroad industry?
12
           Α
                   In the peer review literature.
ΔЗ
                   Peer reviewed literature?
           0
1 4
           A
                   Not that I'm aware of.
15
                   Is there any peer reviewed
           0
16
       literature, that you are aware of, that
117
       quantifies the optimal amount of
18
       repetition that an employee in the railroad
19
       can have in any particular task?
20
                  As far as a study that's been
21
       done in the railroad, published that?
22
                  Scientific study submitted for
23
       peer review.
24
                  Not that I have seen.
           Α
2.5
                  Same question, any type of study
           Jay Deitz & Associates, Ltd.
    (212)374-7700 (516)678-0700 (718)527-7700
                Fax (516)678-4488
```

1 Andres 7.0 concerning awkward postures, that you are 2 3 aware of, scientific study that's been submitted to peer review, where it states 4 5 the optimal amount of awkward posture that a railroad employee should be subjected to? 6 7 Α Well, I guess I have to answer 8 this in that one of the problems that I 9 have is that, first of all, the railroad 10 has very little research that it has 11 Second of all, the compound published. 1.2 question you asked is the optimal amount of 13 repetition. Even in the research literature that is not related to the 14 railroads, again, we don't have an equation 1.5 16 for any particular individual that says 17 that this much repetition is just enough, and if you go just beyond this then it's 18 19 That's the type of dose response too much. 20 relationship information we don't have. 21 Do you have any dose response 22 information concerning the tasks that are 23 performed by the 15 employees that are 24 involved in this case, for the different 25 tasks that they perform?

Jay Deitz & Associates, Ltd. (212)374-7700 (516)678-0700 (718)527-7700 Fax (516)678-4488

```
1
                          Andres
                                                  71
  2
                    Again, since we don't have an
             Α
        equation that directly relates the dose to
  3
        the adverse health outcome, I would have to
  4
  5
        say I don't have an equation like that.
        haven't seen anything like that published.
  6
  7
                    You mentioned you have been to
            0
  8
        other railroad sites?
  9
                    Yes.
 10
                    Have any of these railroads
 h 1.
        hired you to perform a dose response type
        of information, concerning the tasks that
 12
        are performed by these railroad employees?
 ΊЗ
14
            Α
                   No.
15
                   It's not an individual risk
16
       factor by itself that causes a problem, you
       mentioned it's a risk factor combined with
17
       another risk factor, is that right; for
18
19
       example, repetition together with the
20
       length of the time for the repetition?

Research Article

Carpal Tunnel Syndrome in Railroad Workers

ABSTRACT

Cosgrove JL, Chase PM, Mast NJ, Reeves R: Carpal tunnel syndrome in railroad workers. *Am J Phys Med Rehabil* 2002;81:101–107.

Objective: To determine, within a specific industry, if carpal tunnel syndrome (CTS) is associated with job classification or other personal risk factors. To determine if surgical intervention for the treatment of CTS is indicated on the basis of electrodiagnostic criteria.

Design: More than 2500 claimants who screened positive for CTS were subjected to a formal history, physical examination, and electro-diagnostic studies. A total of 900 subjects were randomly selected for this study. The presence of CTS was determined by a method of comparing median minus ulnar nerve distal latency differential (MUD).

Results: There was a statistically significant relationship between CTS and body mass index (P < 0.001), wrist index (P < 0.001), and age (P < 0.001). A total of 43.4% of the participants (391/900) and 38.6% of the wrists (694/1800) had either positive or borderline findings for CTS. There was no difference between the left and right hands. There was no association between job classification and the presence of CTS. Using MUD criteria, more than half of the participants presumed to have CTS did not meet the requirements for diagnosis. Applying the same MUD criteria to all surgical cases, the indication for surgery could not be determined in one-third of the cases (33%, 83/248).

Conclusions: In the population claiming CTS caused by railroad occupations, there was a significant association between CTS and body mass index, age, and wrist index, but not job classification. More than half of the study group and one-third of the surgical subset had normal MUD data.

Key Words: Carpal Tunnel Syndrome, Occupation, Railroad, Obesity, Risk Factors

Dince the 1960s, carpal tunnel syndrome (CTS) as a potential cause of hand and arm complaints has been accepted.1 Initially, occupational CTS was thought to be rare.1 Cross-sectional population studies in the early 1980s postulated a relationship between CTS and occupational hand use.2,3 Many of the early studies were flawed because of the reliance on subjective symptoms or physical signs in the absence of confirmatory electrodiagnostic studies (EDS). More recent cross-sectional and longitudinal studies4-9 have demonstrated mixed results with no consistent association between occupational hand use and CTS.

The theory of repetitive trauma has been postulated as an explanation for occupational CTS.² However, longevity (work years) seems to be negatively correlated with CTS.¹⁰ Similarly, increasing physical activity, in either the able-bodied or wheelchair propulsion population, does not increase the risk of developing CTS.^{11,12}

Personal attributes of obesity as measured by body mass index (BMI)^{4,5,11,13,14} and age^{4,5,15} have been associated with CTS. "Square wrist," defined as the finding of increased wrist index, has been identified by some^{6,16-18} but not by others^{8,19} as associated with slowing of median nerve distal latency. Various common medical disorders are positively correlated with CTS, including diabetes mellitus, gout, and thyroid disease.²⁰

Despite inconsistent scientific evidence linking occupational hand use to CTS, there have been numerous legal proceedings claiming that hand activities have either caused or significantly contributed to the development of CTS. Through the systematic evaluation of a large number of claims filed under the provisions of the Federal Employers Liability Act, the association of CTS with occupational activities and a variety of per-

sonal, physical, and demographic attributes was explored.

METHODS

Thousands of railroad employees have become claimants in actions against their employers under the provisions of the Federal Employers Liability Act. Claimants were identified through a variety of screening primarily organized techniques. through their unions or the plaintiff's bar. Almost all individuals completed a paper and pencil questionnaire and some type of EDS before the filing of their claim. All claimants maintained that they had CTS that was caused or aggravated by occupational activities.

the claimants Prospectively, were subject to a comprehensive history, physical examination, medical record review, and EDS (see below). All evaluations were at the behest of the employer, pursuant to the filing by the claimants. Before the performance of a formal evaluation, the claimants completed a short questionnaire identifying past medical history, current medications, avocational hand use, and a standard pain diagram. Each claimant was then interviewed regarding the onset of symptoms, current symptoms, activities that aggravate or relieve symptoms, and medical or surgical treatment to date and its perceived effectiveness. The specifics of occupational activities were also explored, including dates of service, job classification, specific hand use while at work, hours at work, seasonal aspects of work, and the description of tools used. Past medical history and onwere going medical problems reviewed.

A physical examination was done by one experienced clinician (JLC) to rule out common confounding diagnoses such as cervical radiculopathy, rotator cuff tear, shoulder impingement syndrome, medial or lateral epicondylitis, ulnar or radial nerve entrapment at the elbow, wrist arthritis, carpometacarpal joint arthritis of the thumb, deQuervain's tenosynovitis, flexor or extensor tenosynovitis of the fingers, arthritis of the small joints of the fingers, ulnar neuropathy at Guyon's canal, or vascular impairment to the upper extremity. All individuals underwent anthropometric evaluation using height, weight, calculated BMI, and wrist index.6,17,18 Tripod pinch, lateral pinch, and fiveposition grip strength were tested with a hand-held dynamometer.21 Evaluation for physical signs of CTS assessed Tinel's sign, Phalen's maneuver, and thenar atrophy.22-24 No subject was excluded from the study group because of findings on the physical examination.

Occupational evaluation was undertaken by using a variety of methods: written job analysis, videotaped job analysis, deposition transcripts, and direct interviews. Given the relatively small number of specific trades involved, the authors obtained a good understanding of the work environment. The jobs were then classified into four separate ergonomic categories, consistent with the standards previously described by Silverstein et al.3 In some circumstances, because of change in job environments, there was more than one classification. In those circumstances, the current job was used for classification unless the vast majority of prior work activities involved another job classification.

EDS Technique

Preliminary Study. At the outset of the study, 50 subjects underwent extensive EDS, including sensory, motor, and midpalmar evaluations of both median and ulnar nerves of both hands. All studies were performed by using common techniques with distances of 8 cm (motor distal latency), 14 cm (sensory distal latency), and 8 cm (midpalmar distal latency). Sensory latency with extremely large hands, the distal latency for

ensory evaluation was increased to 5 cm. Needle electromyography was erformed on at least two muscles of ach individual, usually the abductor ollicis brevis and first dorsal inerosseous of the most involved side. ttempts were made to warm the lands. Skin temperature was continially monitored by an Electro-Therm hermistor model TM99A (Cooper Intrument, Middlefield, CT) attached o the surface of the proximal phaanx of the middle metacarpophalanleal joint. Despite our attempts to varm the hands, a wide range of skin emperatures occurred (25.4-33.4°C) etween wrists studied.

Absolute values for distal latency of the motor and sensory nerves were eviewed from the 50 preliminary tudies. The most reliable and useful neasure was determined to be the nedian minus ulnar distal latency lifferential (MUD). This methodology nitigated the effects of age and skin emperature and has been corroboted by recently published studies. 4,28,29

In patients with rough and caloused hands, the midpalmar studies proved to be technically difficult and were, therefore, not universally performed. All EDS were reviewed by one author (JLC) for possible underlying peripheral neuropathy or other peripheral nerve entrapments. Amplitude proved an unreliable measure because of variety of finger diameters, ages, and skin temperatures.30,31 Temperature mathematical conversions were not performed. Abnormalities on electromyography were not helpful in diagnosing CTS but were helpful in differentiating between moderate and severe CTS.27,32

Prospective Study. Over 2500 individuals were then evaluated in a prospective, standard, and rigorous fashion over a 4-yr period. Of that group, 900 files were selected randomly. MUD was considered to be the standard in the diagnosis of CTS. Motor and sensory distal latencies were used

in the evaluation of all individuals. Midpalmar latencies were used selectively—in those cases in which motor or sensory MUDs were either equivocal or contradictory. Midpalmar latencies were also employed in all cases in which motor MUD was abnormal but sensory MUD was considered normal. The utility of mixed midpalmar latencies was limited because of the technical difficulties already described. The following criteria were then employed in the determination of CTS.

- (1) Motor MUD: definitive, >1.5 msec; probable, 1.2–1.5 msec; and normal, <1.2 msec^{32,33}
- (2) Sensory MUD: definitive, >0.8 msec; probable, 0.6-0.8 msec; and normal, <0.6 msec²⁷
- (3) Midpalmar MUD: definitive, >0.5 msec; probable, 0.4-0.5 msec; and normal, <0.4 msec³⁴

The classification of CTS (definitive/probable/normal) was based on the most abnormal MUD among motor, sensory, and midpalmar studies. For statistical analysis, if there was no median sensory response, a default value of 6.0 msec (which always rendered a diagnosis positive for CTS) was assumed. If motor and sensory MUDs were normal and if the ulnar midpalmar latency was unobtainable, a subject was considered not to have CTS.

In those individuals who had undergone prior surgical interventions, a comparison of preoperative and postoperative EDS was undertaken. In many cases, preoperative EDS data were difficult to interpret for reasons such as the absence of ulnar or radial distal latencies, failure to account for skin temperature, poor description of techniques, or no numerical data supplied. CTS surgery was considered appropriate in those cases in which preoperative data were consistent with the diagnosis of CTS. A determination of equivocal was rendered if there were conflicting or insufficient EDS data. Indeterminate cases were those in which both preoperative and postoperative EDS were considered to be normal by the above criteria.

Statistical Analysis

A complete data set of 900 randomly selected individuals (1800 wrists) was obtained from a pool of greater than 2500 claimants. Independent variables were identified by running a stepwise regression on a small pilot sample of 100 patients taken from the 900 randomly selected individuals. The sample of 900 was then randomly divided into a screening sample (n = 500) and a calibration sample (n = 400) for the purpose of creating a cross-validation coefficient. A cross-validation coefficient was appropriate for this study given the researchers' goal to determine how well a regression equation obtained from one sample performs on another sample from the same population.35

Models for the left and right hands were generated using the screening sample and then applied to the cross-validation sample to generate a cross-validation coefficient. Given the high correlation between the left and right indexes, a model using the mean wrist index (for both left and right hands) was created to predict CTS in either hand.

Receiver operating characteristic curve analysis was performed to determine how accurately the regression equation predicted the results.

RESULTS

Railroad workers were almost exclusively men (>99%, 894/900) and relatively old (mean, 50.6 yr; range, 28-71 yr). This was an overweight population with a mean BMI of 30.7 kg./m² (range, 19.6-52.6 kg./m²). Most workers were obese, with only 12% at normal weight (BMI, 19-25.9), 33% mildly overweight (BMI, 26-29.9), 50% moderately obese (BMI, 30-40), and 5% morbidly obese (BMI > 40). 36

TABLE 1Coefficient summary for both hands

Model 1	Unstandardized Coefficients	Standard Error	Beta	t Score	Significance
	-5.807	0.694		-8.368	
Constant	6.364	0.928	0.214	6.855	< 0.001
Wrist index mean	0.01361	0.004	0.113	3.618	< 0.001
Age Body mass index	0.04765	0.006	0.258	8.266	<0.001

Dependent variable: carpal tunnel syndrome; 1 = positive carpal tunnel syndrome; 0 = negative carpal tunnel syndrome.

A square wrist (wrist index, ≥ 0.70)^{16,17} was present in 49.8% of right wrists and 45.0% of left wrists. Hand dominance was consistent with that of the general population: right hand, 88% (788/900); left hand, 8% (75/900); ambidextrous, 4% (37/900).

Using criteria previously described by Silverstein et al., jobs were classified and distributed as follows: category I (low force/low repetition), 18.8%; category II (low force/high repetition), 20.7%; category III (high force/low repetition), 59.8%; category IV (high force/high repetition), 0.7%. The percentage of positive or borderline cases of CTS within each job classification was as follows: category I, 47.9%; category II, 40.0%; category III, 43.4%; and Category IV, 50.0%.

Of the overall population, 43.5% of the claimants (401/900) and 38.6% of the wrists (694/1800) had a deter-

TABLE 2

Correlation of predicted carpal tunnel syndrome with actual carpal tunnel syndrome in the continuation symple

Difference: 0.044

Correlation is significant at the 0.01 level (two-tailed).

mination of either probable or positive CTS. Multiple regression analysis revealed the following model: predicted score = -5.807 + (wrist index $mean \times 6.364) + (age \times 0.01361) +$ $(BMI \times 0.04765), (1 = CTS, 0 = no)$ CTS). Predictive values for the specific coefficients in the model can be seen in Table 1. There was not a significant difference between the CTS models for the left and right hands. There was no statistical significance or positive trend noted in job classifications and CTS. The cross-validation coefficient was 0.044, indicating that the model was generalizable within this population (Table 2).

Receiver operating characteristic curve analysis was performed to help determine if the model provided clinical relevance. The analysis revealed an area under the curve of 0.707 (Fig. 1). Therefore, the model accurately predicted the results almost 71% of the time.

The subjects' wrists were quite symmetric for the diagnosis of CTS; 83% of the participants (795/900) had left and right wrists concordant for the diagnosis of CTS (positive, borderline, or negative). If borderline and cositive cases were combined into one classification positive or

sidered appropriate in 41%, equivocal in 26%, and indeterminate in 33%.

DISCUSSION

Railroad workers claiming occupational CTS were evaluated systematically for three separate but related questions:

- (1) Within this population, was CTS associated with specific occupational duties?
- (2) Were there personal risk factors that could contribute to the presence of CTS?
- (3) In claimants undergoing surgery, were EDS findings consistent with CTS?

The authors' reliance on EDS—specifically, prolongation of MUD—to define CTS may prove contentious. Definitions of CTS vary widely throughout the medical literature. 1,3,6,7,9,23,28 The presence of symptoms in the median nerve distribution has only modest sensitivity, specificity, and predictive value when using EDS as the standard. 37,38 Similarly, clinical signs correlate poorly with abnormal EDS. 22–24 The litigation process raises additional concerns as to the utility of clinical signs and symptoms. The litigation process raises additional concerns as to the utility of clinical signs and symptoms.

of the right wrists (125/900). And 13.4% of the left wrists (122/900). On the basis of electrodiagnostic criteria alone, surgical intervention was con-

niques and normative values are equally problematic. Standard techniques employed over relatively longer distances diminish the effect of measurement error. Comparing median to ulnar latencies mitigates the effect of age and temperature. 4,28,29 The more CTS "sensitive" technique of midpalmar latency25,34 was technically demanding with this population and, therefore, of limited utility. It was elected not to pursue needle electromyography in this population as our preliminary study, consistent with others, confirmed that this did not aid in the diagnosis of CTS, merely differentiating between moderate and severe CTS.32 Median sensory response was absent in only four of 1800 wrists tested. In all of those cases, the motor MUD was also positive for CTS. Therefore, the decision to assign a value of 6.0 msec to the median nerve sensory distal latency had no bearing upon the

The reliance on MUD, the limited use of midpalmar studies, and the absence of needle electromyography may have decreased the sensitivity for determining CTS. It is proposed that the EDS techniques, as employed in this study, represent the most reliable and objective manner of deter-

mining the presence or absence of CTS in a large population.²⁷⁻²⁹

This study is neither cross-sectional nor longitudinal, and extrapolation of these findings to a more general population may prove difficult. It represents a self-selected "screened" population. Accordingly, there can be no determination of incidence or prevalence. This study does suffer from a significant selection bias; a population of primarily blue-collar workers who believe that they have carpal tunnel syndrome and who are willing to enter into litigation. Survivor bias has been suggested as a possible explanation for the failure of previous selective population studies to detect an association between CTS and work activities.41 As reflected in the number of retired or disabled subjects (7%), with almost none being disabled because of CTS (0.3%), it is unlikely that survivor bias is a factor in this study.

Given the extremely small number of female employees examined (6/ 900), no meaningful discussion of sex is possible. Similarly, because the low prevalence, diabetes, gout, and thyroid disease did not reach statistical significance in analysis of variance testing. Consistent with other stud-

ies, the multiple regression analysis revealed a high degree of statistical significance between CTS and age. wrist index and BMI.4,5,6,9,11,13 However, the 71% predictive accuracy of the model is insufficient for clinical application.

Occupational classification was not associated with the presence of CTS. This finding is consistent with other cross-sectional and longitudinal studies. 6-9 The small number of individuals in the most extreme job classification of category IV (0.7%) may have obscured an occupational association. Nevertheless, there was no trend of increased findings of CTS in the groups with higher ergonomic stress.

The study population consisted of railroad workers who were diagnosed as having CTS on the basis of screening tests of questionnaires and some type of EDS. A large percentage of the claimants (56.5%) and wrists (61.4%) were determined not to have CTS by MUD criteria. Similarly, onethird of the claimants who did undergo surgery had normal MUD findings (by our criteria) both before and after surgery. Our results should not be interpreted as a recommendation for the sole reliance on EDS procedures and the elimination of the clinical evaluation in the diagnosis of CTS.1,22,38 However, it must be recognized that there are clear societal implications for the current practice in screening for CTS. Declaring an individual as having CTS has profound effects on feelings of health and well-being, employee-management relations, legal proceedings, and medical procedures. It is incumbent on electromyographers to employ rigorous and appropriate standards in the performance of carpal tunnel evaluations. At present, the association of carpal tunnel syndrome with hand activities remains unproved. It may be that with CTS, as with many of the other medical and legal issues of our time, "litigation, fear, bias, and greed interfere with

nerve in industry: A cross-sectional and longitudinal study involving 429 workers. J Occup Environ Med 1992;34:379-83

scientific efforts to answer questions of importance to the public health and that antiscientific social attitudes encourage premature or ill-informed political and legal solutions to medical questions."

Continuing Call for Papers

The primary purpose of *The American Journal of Physical Medicine & Rehabilitation* (AJPM&R) is to facilitate the dissemination of scholarly work on the practice, research, and educational aspects of physical medicine and rehabilitation. Toward fulfilling its purpose, the AJPM&R invites submission of original papers, particularly in the categories given below, for consideration to publish:

Scientific research papers: Scientific investigations that advance the field of physiatric medicine.

Literature reviews: Critical summaries and assessments of previously published information on topics related to the field of physical medicine and rehabilitation. Because of space limitations, reviews will be accepted only under special circumstances.

Case studies: Presentations of the diagnosis, treatment, and outcomes of individual cases of specific conditions to improve patient care.

Brief reports: Short articles reporting on research techniques, statistical techniques, and educational and clinical aspects of physical medicine and rehabilitation.

Clinical notes: Comments on patient diagnosis or treatment resulting from personal clinical experience.

Commentaries: Indepth, editorial-like, articles on matters relating to the clinical, scientific, and educational aspects of physical medicine and rehabilitation.

Letters to the Editor: Objective critiques and comments covering material published in a recent issue of the Journal.
